STELLA

WELDING ALLOYS

STELLA WELDING ALLOYS is a specialized supplier of brazing alloys, fluxes and filler metals for **Brazing**, **Soldering** and **Welding**. Our headquarters are located in the **north of Italy** from where we supply **Customers** in more than **60 countries worldwide**. With more than **20 years of experience**, we operate in HVAC&R, diamond and carbide tipped tools, heat exchangers, electro-mechanical, metal furniture industries and others, being a reliable source for worldwide leader original equipment manufacturers (OEMs). Our Quality System is certified ISO 9001/2008.

We offer:

- the most comprehensive and widest range of different alloys and products, from general purpose to special applications
- variety of different make-ups, from standard forms to custom engineered forms
- conformity to the main international, technical and environmental standards
- complete source for technical information, consulting and assistance

We operate regularly in:
English, German, French, Spanish, Russian and Italian.

Section 1

SILVER BASED ALLOYS - CADMIUM FREE

The following are general purpose brazing alloys, suitable to join easily a wide range of ferrous and non-ferrous base materials (iron, steel, stainless steel, copper, brass, etc.). Continuous service operating temperatures of joints brazed with these alloys range up to approx 200 °C. When joining stainless steel in wet environments, in order to avoid failure of the joint due to interfacial corrosion, it is recommended to use zinc-free alloys (Ag60Sn/1), or alloys with Nickel additions: see page 8.

Available in many different presentation forms (rods, flux-coated rods, wires, strips, rings, preforms, pastes and powders), these alloys are very free flowing, ductile and strong.

All these alloys do not contain Cadmium, do not present the Health & Safety concerns associated with Cadmium-Bearing Alloys and are compliant with the RoHS regulation. They are divided in two categories: alloys with Tin and alloys without Tin; Tin being used to lower the melting temperature of the alloy.

When brazing in an oxidizing environment (that is: in air), the use of a proper flux is required: see page 18.

Powder and Paste	Rings	Preforms from Wire and from Strip

SILVER BASED ALLOYS - SPECIAL APPLICATIONS

The following are alloys that, thanks to the addition of specific elements, or to their particular composition, have improved characteristics that make them suitable for specific applications or to operate in difficult conditions.

In particular, the addition of Nickel helps in joining difficult-to-braze materials (such as stainless steel, tool steel, tungsten carbide, nickel and nickel alloys, etc.) and improves corrosion resistance.

Manganese helps in brazing carbides.

Alloys without Copper are ammonia resistant.

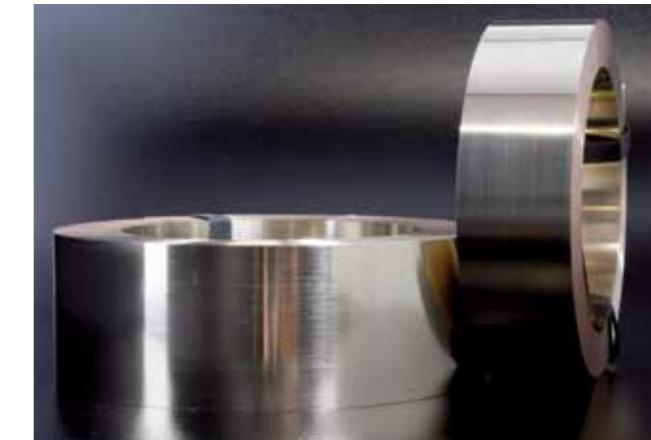

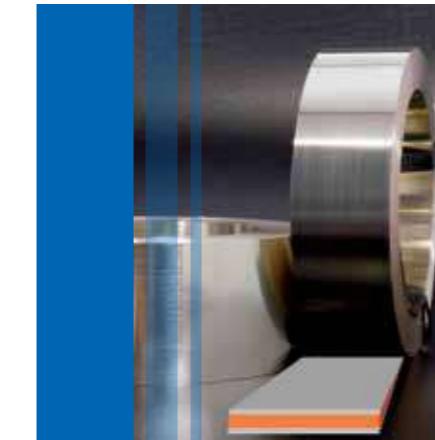

Alloys without Zinc are suitable for brazing in oven and may be used to join stainless steels in wet conditions to avoid interfacial corrosion problems.

Alloys with Indium are suitable to join pieces that will undergo TiN coating.

SILVER BASED ALLOYS - TRIMETALS

Trimetals strips consist of two layers of silver brazing alloy clad onto a copper core and are very popular for brazing of carbides onto steel, especially large pieces.

The copper core of the strip absorbs and relieves the stresses caused by the difference in thermal expansion between carbide and base metal, thus helping to prevent cracking.

SILVER BASED ALLOYS - CADMIUM BEARING

The brazing alloys presented in this page are very versatile, high-strength, free-flowing and exhibit the lowest melting points of all silver based alloys.

They can be used to join a wide range of base materials.

Continuous service operating temperatures of joints brazed with these alloys range up to approx 200 °C.

Because of the presence of Zinc and Cadmium, and the possible failure of the joint due to the mechanism of interfacial corrosion, these alloys are not recommended for the joining of stainless steels in wet conditions; in these conditions, zinc free and cadmium free alloys, or alloys with nickel additions are preferred: see page 8.

Since Cadmium and its oxides are toxic, special safety precautions must be followed during brazing operations (e.g. mechanical ventilation and/or respiratory mask).

The use of these alloys in applications where food, beverages and/or human health in general is involved, is forbidden.

CADMUM BEARING BRAZING ALLOYS HAVE BEEN BANNED IN THE EUROPEAN UNION SINCE DECEMBER 2011 (EU COMMISSION REGULATION NO. 494/2011) AND THEIR USAGE IS NO MORE ALLOWED: PLEASE CONTACT OUR TECHNICAL AND COMMERCIAL STAFF TO GET AN ADVICE ON SELECTING THE MOST APPROPRIATE CADMIUM-FREE SUBSTITUTES: see page 47.

BRASS AND COPPER BASED ALLOYS

This group includes four different categories of high-temp brazing alloys:

- General Purpose Brasses
- Brasses with addition of Nickel
- High temperature Copper Alloys for special applications
- Copper for furnace brazing

All these alloys are economical to use and can be generally supplied in a variety of forms (rods, wires, strips, preforms, powder and pastes). General purpose brasses can be used for brazing and for the Oxy-Fuel Gas Braze-Welding process, with liquid flux spread through the torch flame.

COPPER PHOSPHOROUS ALLOYS

The Copper-Phosphorous alloys are extensively used to join copper and copper alloy base metals (brass, bronzes). They have self-fluxing properties when used on copper and may or may not contain Silver. A flux is required when joining brass or bronze. Continuous service operating temperatures of joints brazed with these alloys range up to approx 200 °C. Corrosion resistance is satisfactory, except when the joints are exposed to sulfurous environments, especially at elevated temperatures. Copper-Phosphorous alloys should not be used on ferrous, nickel based alloys, or copper-nickel alloys with more than 10% nickel, in order to avoid premature failure of the joint due to the formation of brittle intermetallic phases. They are available in rods, wires, rings, preforms, pastes and powders. Ag5CuP and Ag15CuP are also available in strip form.

ALUMINIUM & ZINC-ALUMINIUM ALLOYS

Alloys based on Aluminium and/or Zinc for brazing of Aluminium.

Continuous service operating temperatures of joints brazed with Al/Si alloys range up to approx 150 °C.

Zinc-Aluminum alloys are also suitable for copper-aluminium and brass-aluminium joints.

SOFT SOLDERERS

Alloys based on Tin for Soft-Soldering.

Lead and Cadmium bearing alloys have particular Health and Safety limitations in applications and uses.

Lead-free and Cadmium-free alloys, compliant to RoHS regulation, are available.

Available as ingots, bars, sticks, wires and flux-cored wires.

Flux cored wires are available with different cores for various applications:

- General purpose soldering
- Soldering of stainless steel
- Soldering of aluminium
- Electromechanics
- Electrical Engineering
- Electronics (no clean)
- Others

BRAZING POWDERS & PASTES

A wide range of filler metals in powder and paste is available.

Brazing is performed in air, under protective atmosphere, or in vacuum, by flame, induction or in furnace.

Powders are available in different grain sizes, from coarse to fine.

Pastes can be supplied with and without flux, with various binders and with different metal content percentages, in order to fulfill the most demanding applications.

To select the most appropriate brazing paste, many factors have to be taken into account, such as: type and dimensions of pieces, materials to be joined, heating method, type of atmosphere, etc.

Consequently technical testing is generally required to select the most appropriate paste for the specific customer application.

850	0,8500	0,0335	20	-	-	

(*) a "+" sign before the sieve mesh number indicates that the particles are retained by the sieve.

a "-" sign before the sieve mesh number indicates that the particles pass through the sieve. For instance if the particle size of a powder is described as -140 +325 mesh, then 90% or more of the powder will pass through a 140 mesh sieve (particles smaller than 106 μ) and will be retained by a 325 mesh sieve (particles larger than 45 μ). If a powder is described as -100 mesh, then 90% or more of the powder will pass through a 100 mesh sieve (particles smaller than 150 μ).

FLUXES

Our range:

- Fluxes for Silver Based Alloys
- Fluxes for Brass and Copper Based Alloys
- Liquid Fluxes for Braze-Welding
- Fluxes for Aluminium alloys
- Fluxes for Soft Soldering alloys

Available in different presentations, such as:
Powder, Paste and Liquid form.

FLUXES FOR SILVER BASED ALLOYS:

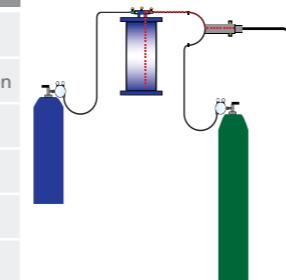

CODE	ACTIVITY RANGE	MAKE-UP		STANDARD	DESCRIPTION
		°C	Powder	Paste	EN 1045
FLUX AG1	550-800	✓	✓	FH 10	General purpose
FLUX AG3	600-850	✓	✓	FH 10	For high temperatures
FLUX AG4	550-850	✓	✓	FH 10	General purpose - Very wide range of temperatures
FLUX AG5	700-1000	✓	✓	FH 20	For very high temperatures
FLUX AG6	550-850	✓		FH 11	For Aluminium Bronze
FLUX AG7	550-800	✓	✓	FH 10	General purpose. Also for Stainless Steel.
FLUX AG8	550-850		✓	FH 12	For Stainless Steel and Hard Metal - Brown paste
FLUX AG11	550-800		✓	FH 10	General purpose. Also for Stainless Steel - For use with automatic dispensing machines
FLUX AG12	550-850		✓	FH 12	For Stainless Steel and Hard Metal - For use with automatic dispensing machines
ANTIFLUX			✓		Prevents wetting of brazing alloy

FLUXES FOR BRASS AND COPPER BASED ALLOYS:

CODE	ACTIVITY RANGE	MAKE-UP		STANDARD	DESCRIPTION
		°C	Powder	Paste	EN 1045
FLUX BR1	800-1000	✓	✓	FH 21	Brazing with Brass
FLUX BR4	700-1200	✓	✓	FH 21	For high temperatures
FLUX BR5	1000-1300	✓	✓	FH 30	For very high temperatures
FLUX BR7	760-1200		✓	FH 21	For very high temperatures

LIQUID FLUXES FOR BRAZING AND FOR BRAZE-WELDING:

CODE	ACTIVITY RANGE	STANDARD	DESCRIPTION	
			°C	EN 1045
FLUX LI1	550-1100	FH 21	For Brazing with Vaporizer systems. Medium Concentration	
FLUX LI2	550-1100	FH 21	For Brazing with Vaporizer systems. Medium-High Concentration	
FLUX LI3	550-1100	FH 21	For Brazing with Vaporizer systems. High Concentration	
FLUX LI1 ECO	550-1100	FH 21	Non - toxic formulation	
FLUX LI2 ECO	550-1100	FH 21	Non - toxic formulation	
FLUX LI3 ECO	550-1100	FH 21	Non - toxic formulation	

FLUXES FOR ALUMINIUM:

CODE	ACTIVITY RANGE	MAKE-UP		STANDARD	DESCRIPTION	
		°C	Powder	Paste	EN 1045	
FLUX AL1/d	550-650		✓	✓	FL 10	Corrosive flux for flame brazing
FLUX AL1 NC	550-650		✓	✓	FL 20	Non-corrosive flux for flame, induction and furnace (C.A.B.) brazing
FLUX AL3	550-650		✓		FL 10	Autogenous welding of pure aluminium
FLUX AL4	550-650		✓		FL 10	Autogenous welding of Al-Si and Al-Mg alloys
FLUX AL6	440-470			✓		Non-corrosive flux for brazing with Zinc-Aluminium alloys

FLUXES FOR SOFT SOLDERS

CODE	MAKE-UP		STANDARD		DESCRIPTION
	Paste	Liquid	DIN 8511	EN 29454-1	
FLUX SN1	✓	✓	F - SW12	3.1.1.A/C	General purpose
FLUX SN2		✓	F - SW11	3.2.2.A	For Stainless Steel
FLUX SN6		✓	F - SW25	2.1.3.A	For Electromechanics
FLUX SN35		✓		2.1.2.A	For aluminium and low-alloyed aluminium alloys

OTHER PACKAGES AVAILABLE UPON REQUEST

Powder:	Packages of: 0,1 - 0,25 - 0,5 - 1 - 10 - 20 kg
Paste:	Packages of: 0,1 - 0,25 - 0,5 - 1 - 1,5 - 10 - 20 kg
Liquid:	Packages of: 0,25 - 0,5 - 1 - 5 - 10 - 25 lt • Drums of 60 - 200 lt (LI1 - LI2 - LI3)

TECHNICAL CHARTS
WELDING

Section 2

ALUMINIUM AND MAGNESIUM BASED ALLOYS FOR WELDING

Alloys based on aluminium and magnesium, suitable for the TIG/MIG techniques.

Used to join aluminium and magnesium base metals.

Some alloys are also suitable for the brazing technique.

CODE	COMPOSITION %							CORRESPONDING STANDARDS	
	Al	Si	Mg	Mn	Zn	Zr		DIN 1732	AWS A5.10
ALUMINIUM:

CHARACTERISTICS MAKE-UP

Rods	Ø: 1,2 → 5 mm	Length: 1.000 mm
Wires	Ø: 0,8 → 3,2 mm	On Spools DIN 300, DIN 200, and DIN 100
Flux-cored rods & wires	Ø: 2 → 5 mm	Only Al99,5 - AISi5 - AISi12
Rings		

COPPER BASED ALLOYS FOR WELDING

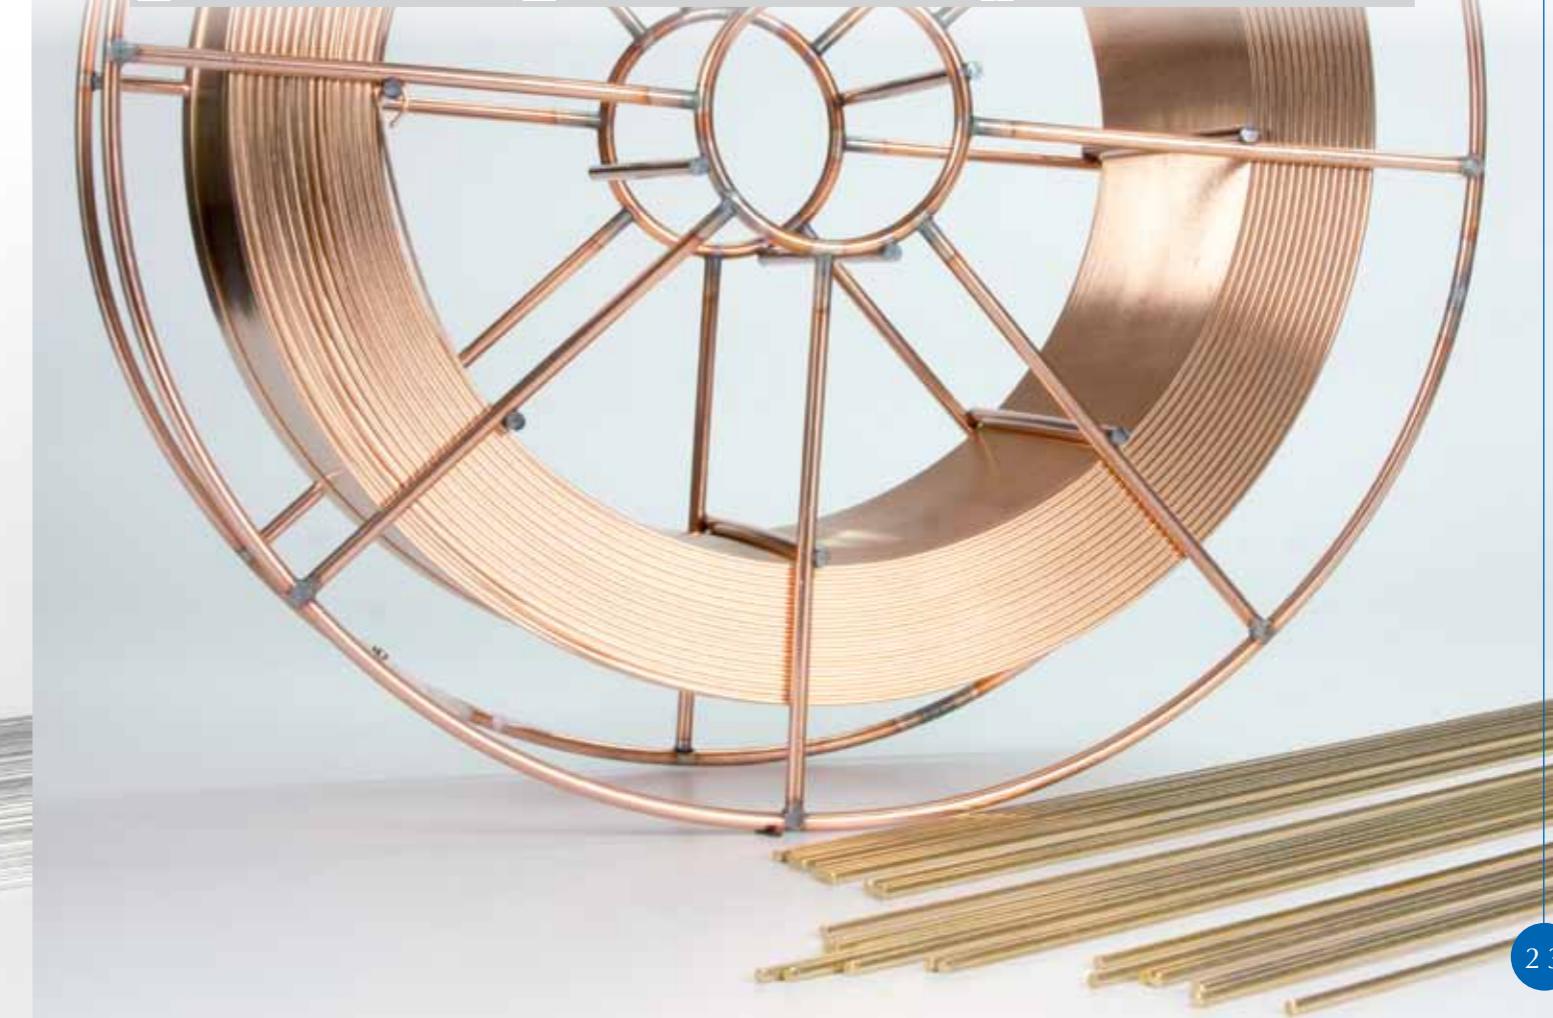

Alloys based on copper suitable for the TIG / MIG techniques.

Supplied as rods and wires, some alloys are also suitable for the brazing technique.

ELECTRODES:

- Rutile and cellulosic electrodes
- Basic electrodes for low-alloyed steels
- Basic electrodes for steels resistant to high temperatures
- Basic electrodes with high tensile strength
- Basic electrodes for steels resistant to low temperatures
- Electrodes for welding and repair of stainless steels
- Electrodes for cast iron repair
- Nickel based electrodes
- Aluminium electrodes
- Bronze electrodes
- Electrodes for surcharge
- Electrodes for general maintenance
- Electrodes for Cement Plants and Quarries

APPLICATION CHARTS

CARBIDE AND DIAMOND TIPPED TOOLS

Brazing alloys, with and without silver, for manufacturing of:
tungsten carbide tipped tools, diamond tipped tools, wood-working tools, tools
for working and cutting of stone, cement, asphalt, saw blades, plastic materials
crushers, mining and drilling tools, knives and tools for paper cutting, surgical
instruments, plowshares, knives for cardboard, plastic, leather, etc.

HEAT EXCHANGERS INDUSTRIAL AND HOME REFRIGERATORS UNITS AND COMPONENTS

Brazing alloys for manufacturing of:
heat-exchangers, engine radiators, home and industrial refrigerators, air conditioners, wall boilers, gas boilers, electric home appliances, coils, condensers, evaporators, compressors for cooling, refrigerated cabinets, etc.

COPPER-PHOSPHOROUS ALLOYS

CODE	COMPOSITION %				MELTING RANGE SOL - LIQ	FLOW POINT	STANDARD	NOTES
	Ag	Cu	P	Sn				

ALLOYS

CuP6	94	6		710-890	760	CuP 179	RoHS Compliant alloys. For copper-copper and copper-brass joints. For joining copper to copper no flux is necessary. These alloys are not suitable for joining ferrous materials, steels and nickel alloys. They are also not suitable to be used in sulfur containing atmospheres. Particularly good and clean joints can be obtained by using these alloys along with liquid flux (LI1/LI2) spread through the torch flame by vaporizer systems. Alloys with Silver are recommended for joints subject to vibrations. These alloys are available as rods, flux-coated rods, wires and rings.
CuP7	93	7		710-820	730	CuP 180	
CuP8	92	8		710-770	720	CuP 182	
CuP7Sn	86	7	7	650-700	700	CuP 386	
Ag2CuP	2	91,5	6,5	645-825	740	CuP 279	
Ag5CuP	5	89	6	645-815	710	CuP 281	
Ag15CuP	15	80	5	645-800	700	CuP 284	

FLUXES

FLUX AG4	General purpose. For copper-brass joints.
FLUX LI1	Liquid flux. For brazing with vaporizer systems. Medium concentration.
FLUX LI2	Liquid flux. For brazing with vaporizer systems. Medium-high concentration.

Brasses for high temperature brazing.
RoHS Compliant alloys. Available as rods, flux-coated rods, wires and rings.
Cu59ZnAg is suitable for galvanized steel.

FLUXES

FLUX BR1	Brazing with brass filler metals.						
FLUX LI1	Liquid flux. For brazing with vaporizer systems. Medium concentration.						
FLUX LI2	Liquid flux. For brazing with vaporizer systems. Medium - high concentration.						
FLUX LI3	Liquid flux. For brazing with vaporizer systems. High concentration.

BAN OF CADMIUM IN BRAZING FILLER METALS RECOMMENDED ALTERNATIVES

Cadmium bearing brazing alloys have been banned in the European Union since december 2011 (EU Commission Regulation no. 494/2011) and their usage is no more allowed.

A full line of cadmium-free alternative alloys is available.

Please see the attached table that provides you a guidance in the process of selecting the proper alternatives:

CD-CONTAINING ALLOY		CD-FREE ALTERNATIVE ALLOY			
ALLOY	MELT. RANGE (°C)	BEST EQUIVALENT	MELT. RANGE (°C)	POSSIBLE EQUIVALENT	MELT. RANGE (°C)
Ag13Cd	605-795	Ag20	690-810		
Ag17Cd	620-760	Ag20	690-810		
Ag19Cd	630-730	Ag25Sn	680-760		
Ag20Cd	620-750	Ag25Sn	680-760	Ag20	690-810
Ag21Cd	620-730	Ag30Sn	665-755	Ag25Sn	680-760
Ag25Cd	605-710	Ag34Sn	630-730	Ag30Sn	665-755
Ag30Cd	610-690	Ag40Sn	650-710	Ag34Sn	630-730
Ag34Cd	610-670	Ag45Sn	640-680	Ag38Sn	650-720
Ag38Cd	610-650	Ag45Sn	640-680	Ag40Sn	650-710
Ag40Cd	595-630	Ag55Sn / Ag56Sn	630-660 / 620-655	Ag45Sn	640-680
Ag42Cd	605-620	Ag56Sn / Ag55Sn	620-655 / 630-660	Ag45Sn	640-680
Ag45Cd	605-630	Ag56Sn	620-655	Ag55Sn	630-660
Ag50Cd	620-640	Ag56Sn	620-655	Ag55Sn	630-660
Ag50CdNi	635-690	Ag49MnNi	680-705		

Cadmium-free alloys are available in a wide range of compositions for different applications. They are free-flowing, ductile and strong and generally require higher brazing temperatures than do cadmium-bearing alloys.

Should you need further advice, information, or technical data, please feel free to contact us: our commercial and technical staff will help you select the most appropriate cadmium-free substitutes.

STEPS FOR A SUCCESSFUL BRAZING

1. Ventilation

Ensure there is sufficient ventilation: brazing operations should never be undertaken in confined areas or if there is not enough ventilation.

2. Joint gap

Ensure that, at brazing temperature, the brazing joint will have the proper clearance (for "in air" brazing with flux, proper gaps range normally from 0,05 to 0,20 mm).

3. Pre-braze cleaning

Carefully and thoroughly clean the pieces to be brazed: joint surfaces must be free from any contaminant, such as oil, lubricants, dust, grease, etc.

4. Fluxing

Apply a proper quantity of flux on the pieces in order to protect the joint surfaces from oxidation (note: when brazing copper to copper with copper-phosphorous alloys, no flux is necessary).

5. Assembly and fixturing

Assemble the pieces and ensure that they will maintain position and alignment during brazing (fixturing may be needed).

6. Heating

Heat evenly and uniformly the joint area, insisting more on heavier sections.

Do not try to melt the filler alloy by directly directing the flame on the rod.

7. Brazing

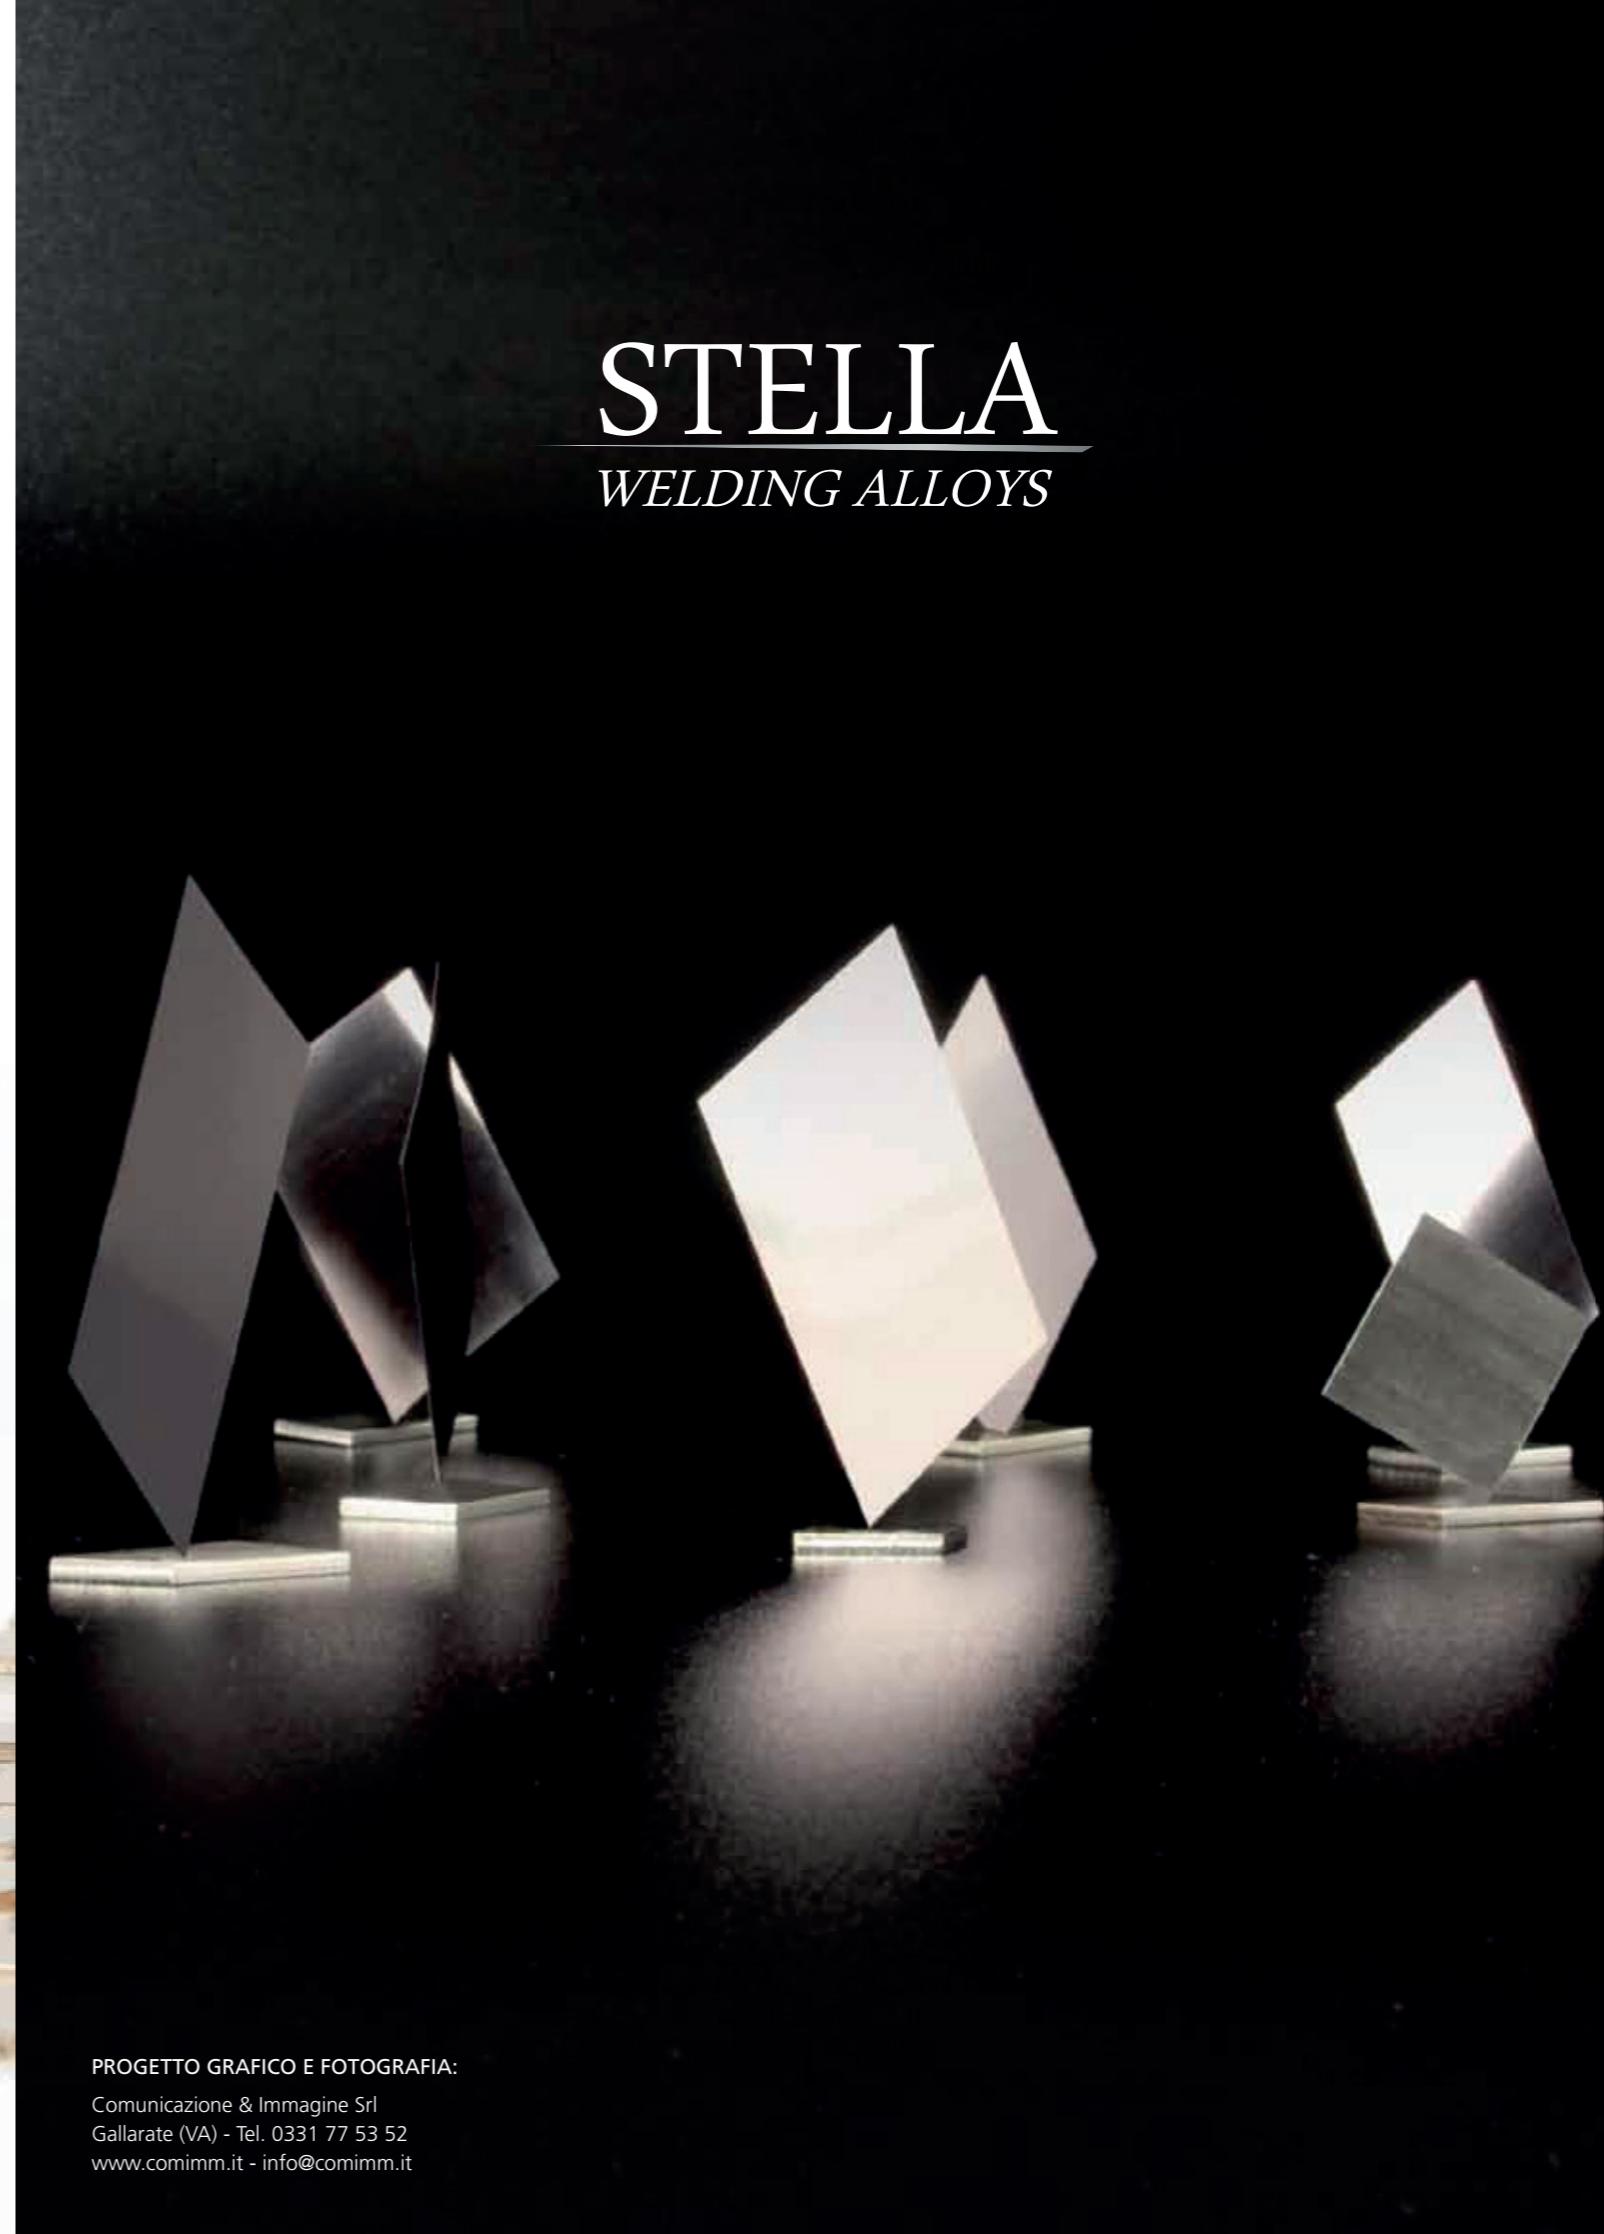

As soon as the pieces reach the brazing temperature, feed the rod in the joint area and let it melt and flow.

Capillary action will draw the molten alloy inside of the joint.

Avoid overheating, which might lead to damaged or deformed pieces, unsound joints, and emission of harmful fumes.

8. Post-braze cleaning

After brazing, allow the pieces to cool down and remove flux residues by washing in warm water, brushing, or other methods (chemical pickling, ultrasounds, etc.).
